$\S 1$ SAT-LIFE-FILTER INTRO 1

1. Intro. After a SAT solver has solved a problem set up with the SAT-LIFE programs, we want to see the answer in a convenient form. This program accepts the results (one line per solution) and converts the literals of the form dad into the rectangular "dots" format of periods and asterisks.

Input and output go from stdin to stdout.

```
#include <stdio.h>
#include <stdlib.h>
   char pix[101][101];
   \langle \text{Subroutine 2} \rangle;
   main()
   {
      register int c, i, j, bit, maxi = 0, maxj = 0;
      while (1) {
         if (feof (stdin)) break;
         \langle \text{Process the next line of input 3} \rangle;
   }
2. \langle \text{Subroutine 2} \rangle \equiv
  int nextchar(void)
      register int c = fgetc(stdin);
      if (c \neq \texttt{EOF}) return c;
      exit(-1);
This code is used in section 1.
3. \langle \text{Process the next line of input 3} \rangle \equiv
   for (c = nextchar(); c \equiv ' \Box';)
      \langle \text{Process a literal 4} \rangle;
   \langle \text{Output the pixels found 6} \rangle;
This code is used in section 1.
```

2 INTRO

SAT-LIFE-FILTER

 $\S 4$

```
4. \langle \text{Process a literal 4} \rangle \equiv
   c = nextchar();
   if (c \neq , \tilde{}) bit = 1;
   else {
      bit = 0;
      c = nextchar();
   for (i = 0; c \geq 0, \land c \leq 9; c = nextchar()) i = 10 * i + c - 0;
   if (i \ge 100) {
      \mathit{fprintf}\,(\mathit{stderr}, \texttt{"Eh?} \sqcup \texttt{I} \sqcup \texttt{found} \sqcup \texttt{a} \sqcup \texttt{number} \sqcup \texttt{of} \sqcup \texttt{more} \sqcup \texttt{than} \sqcup \texttt{two} \sqcup \texttt{digits!} \setminus \texttt{n"});
      exit(-2);
   if (c \neq 'a') goto litdone;
   c = nextchar();
   for (j = 0; c \ge 0) \land c \le 9; c = nextchar()) j = 10 * j + c - 0;
   if (j \ge 100) {
      fprintf(stderr, "Eh? \sqcup I \sqcup found \sqcup a \sqcup number \sqcup of \sqcup more \sqcup than \sqcup two \sqcup digits! \n");
      exit(-2);
   if (c \neq ' \cup ' \land c \neq ' \setminus n') goto litdone;
   \langle \text{Record the pixel value } (i, j) | 5 \rangle;
littone: while (c \neq ' \sqcup ' \land c \neq ' \setminus n') c = nextchar();
This code is used in section 3.
5. \langle \text{ Record the pixel value } (i,j) \rangle \equiv
   if (i > maxi) maxi = i;
   if (j > maxj) maxj = j;
   pix[i][j] = bit;
This code is used in section 4.
6. (Output the pixels found 6) \equiv
   for (i = 0; i \le maxi + 1; i++) {
      for (j = 0; j \leq maxj + 1; j \leftrightarrow) putchar(pix[i][j]? '*' : '.');
      putchar('\n');
   putchar('\n');
This code is used in section 3.
```
