INTRODUCTION

§1

1* Introduction. This is a hastily written implementation of the daghull algorithm.

```
format Graph int
                              /* gb\_graph defines the Graph type and a few others */
  format Vertex int
  format Arc int
  format Area int
#include "gb_graph.h"
#include "gb_rand.h"
#include "gb_miles.h"
  int n = 128;
  (Global variables 2)
  \langle \text{Procedures } 13^* \rangle
  main(argc, argv)
       int argc;
       char **argv;
     ⟨Local variables 7⟩
     Graph *q;
     int kk, kkk, xrnd, yrnd;
     char str[10];
     if (argc \neq 2) n = 100;
     else if (sscanf(argv[1], "%d", &n) \neq 1) {
       printf("Usage: \_\%s_{\bot}[n] \n", argv[0]); exit(1);
     else if (n < 20) {
        printf("n_{\sqcup}should_{\sqcup}be_{\sqcup}at_{\sqcup}least_{\sqcup}20! \n"); exit(1);
     g = gb\_new\_graph(n);
     gb\_init\_rand(0);
     for (kk = 0, v = g \rightarrow vertices; kk < n; kk +++, v +++) {
        sprintf(str, "%d", kk);
       v \rightarrow name = gb\_save\_string(str);
       kkk = kk/(n/10) + 1;
        kkk = kkk * kkk * 100;
        xrnd = gb\_next\_rand();
       if (xrnd \& #1000000) xrnd = xrnd % 100;
       else xrnd = kkk - (xrnd \% 100);
        yrnd = gb\_next\_rand();
       if (yrnd & #1000000) {
          v \rightarrow x.I = xrnd - kkk/2;
          v \rightarrow y.I = (yrnd \% kkk) - kkk/2;
       }
       else {
          v \rightarrow x.I = (yrnd \% kkk) - kkk/2;
          v \rightarrow y.I = xrnd - kkk/2;
       if (n < 150) printf("point_{\square}\%s=(\%d,\%d)\n", v \rightarrow name, v \rightarrow x.I, v \rightarrow y.I);
     mems = ccs = 0;
     \langle \text{ Find convex hull of } q \rangle;
     printf("Total_of_wd_mems_and_wd_calls_on_ccw.\n", mems, ccs);
```

 qb_save_string : 1.*

Graph: 1*

13* Determinants. I need code for the primitive function *ccw*. Floating-point arithmetic suffices for my purposes.

We want to evaluate the determinant

$$ccw(u, v, w) = \begin{vmatrix} u(x) & u(y) & 1 \\ v(x) & v(y) & 1 \\ w(x) & w(y) & 1 \end{vmatrix} = \begin{vmatrix} u(x) - w(x) & u(y) - w(y) \\ v(x) - w(x) & v(y) - w(y) \end{vmatrix}.$$

```
\langle \text{Procedures } 13^* \rangle \equiv
   int ccw(u, v, w)
           Vertex *u, *v, *w;
   { register double wx = (double) w \rightarrow x.I, wy = (double) w \rightarrow y.I;}
       register double det = ((double) \ u \rightarrow x.I - wx) * ((double) \ v \rightarrow y.I - wy) - ((double))
              u \rightarrow y.I - wy) * ((\mathbf{double}) \ v \rightarrow x.I - wx);
       Vertex *uu = u, *vv = v, *ww = w, *t;
       if (det \equiv 0) {
           det = 1:
           \text{if } (u \neg x.I > v \neg x.I \lor (u \neg x.I \equiv v \neg x.I \land (u \neg y.I > v \neg y.I \lor (u \neg y.I \equiv v \neg y.I \land u \neg z.I > v \neg z.I)))) \ \{ v \neg x.I > v \neg x.I \land (u \neg y.I = v \neg x.I \land (u \neg y.I \rightarrow v \neg x.I)) \} \}
              t = u; u = v; v = t; det = -det;
           if (v \rightarrow x.I > w \rightarrow x.I \lor (v \rightarrow x.I \equiv w \rightarrow x.I \land (v \rightarrow y.I > w \rightarrow y.I \lor (v \rightarrow y.I \equiv w \rightarrow y.I \land v \rightarrow z.I > w \rightarrow z.I)))) {
              t = v; v = w; w = t; det = -det;
           \text{if } (u \neg x.I > v \neg x.I \lor (u \neg x.I \equiv v \neg x.I \land (u \neg y.I > v \neg y.I \lor (u \neg y.I \equiv v \neg y.I \land u \neg z.I < v \neg z.I)))) \  \, \{ v \neg x.I > v \neg x.I \lor (u \neg x.I \equiv v \neg x.I \land (u \neg y.I \Rightarrow v \neg x.I)) \} \  \, \{ v \neg x.I > v \neg x.I \land (u \neg x.I \Rightarrow v \neg x.I) \land (u \neg x.I \Rightarrow v \neg x.I) \land (u \neg x.I \Rightarrow v \neg x.I) \} \}
              det = -det;
           }
       if (n < 150)
           printf("cc(%s; u%s; u%s) uisu%s n", uu - name, vv - name, ww - name, det > 0? "true": "false");
       ccs++;
       return (det > 0);
