§1 SSXCC0 INTRO 1

(See https://cs.stanford.edu/~knuth/programs.html for date.)

1. Intro. This program is an "XCC solver" that I'm writing as an experiment in the use of so-called sparse-set data structures instead of the dancing links structures that I've played with for thirty years. I plan to write it as if I live on a planet where the sparse-set ideas are well known, but doubly linked links are almost unheard-of. As I begin, I know that the similar program SSXC1 works fine.

I shall accept the DLX input format used in the previous solvers, without change, so that a fair comparison can be made. (See the program DLX2 for definitions. Much of the code from that program is used to parse the input for this one.)

My original attempt, SSXC0, kept the basic structure of DLX1 and changed only the data structure link conventions. The present version incorporates new ideas from Christine Solnon's program XCC-WITH-DANCING-CELLS, which she wrote in October 2020. In particular, she proposed saving all the active set sizes on a stack; program SSXC0 recomputed them by undoing the forward calculations in reverse. She also showed how to unify "purification" with "covering."

2 INTRO SSXCC0 §2

2. After this program finds all solutions, it normally prints their total number on *stderr*, together with statistics about how many nodes were in the search tree, and how many "updates" were made. The running time in "mems" is also reported, together with the approximate number of bytes needed for data storage. (An "update" is the removal of an option from its item list, or the removal of a satisfied color constraint from its option. One "mem" essentially means a memory access to a 64-bit word. The reported totals don't include the time or space needed to parse the input or to format the output.)

Here is the overall structure:

```
#define o mems++
                           /* count one mem */
#define oo mems += 2 /* count two mems */
                                 /* count three mems */
#define ooo mems += 3
                      /* used for percent signs in format strings */
#define O "%"
\#define mod %
                      /* used for percent signs denoting remainder in C */
#define max\_level 5000
                                /* at most this many options in a solution */
#define max\_cols 100000
                                 /* at most this many items */
#define max\_nodes 10000000
                                   /* at most this many nonzero elements in the matrix */
\#define savesize 10000000
                                  /* at most this many entries on savestack */
#define bufsize (9*max\_cols + 3) /* a buffer big enough to hold all item names */
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <ctype.h>
#include "gb_flip.h"
  typedef unsigned int uint; /* a convenient abbreviation */
  typedef unsigned long long ullng; /* ditto */
  \langle \text{Type definitions } 7 \rangle;
   \langle \text{Global variables } 3 \rangle;
  \langle \text{Subroutines } 10 \rangle;

     register int c, cc, i, j, k, p, pp, q, r, s, t, cur\_choice, cur\_node, best\_itm;
     \langle \text{Process the command line 4} \rangle;
     \langle \text{Input the item names } 14 \rangle;
     \langle \text{Input the options } 16 \rangle;
     if (vbose & show_basics) (Report the successful completion of the input phase 23);
     if (vbose \& show\_tots) (Report the item totals 24);
     imems = mems, mems = 0;
     if (baditem) (Report an uncoverable item 22)
    else {
       if (randomizing) \langle Randomize the item list 25 \rangle;
       \langle Solve the problem 26 \rangle;
     }
  done: if (vbose & show_profile) \langle Print the profile 41 \rangle;
     if (vbose & show_max_deq)
       fprintf(stderr, "The maximum branching degree was "O"d. n", maxdeq);
     if (vbose & show_basics) {
       fprintf(stderr, "Altogether_{\sqcup}"O"llu_{\sqcup}solution"O"s,_{\sqcup}"O"llu+"O"llu_{\sqcup}mems,", count,
            count \equiv 1 ? "" : "s", imems, mems);
       bytes = (itemlength + setlength) * sizeof(int) + last\_node * sizeof
            (node) + 2 * maxl * sizeof(int) + maxsaveptr * sizeof(twoints);
       fprintf(stderr, " \sqcup "O" llu \sqcup updates, \sqcup "O" llu \sqcup bytes, \sqcup "O" llu \sqcup nodes, ", updates, bytes, nodes);
       fprintf(stderr, "\cost\"O"11d\%", \n", mems?(200*cmems + mems)/(2*mems):0);
```

4 INTRO SSXCC0 §3

3. You can control the amount of output, as well as certain properties of the algorithm, by specifying options on the command line:

- 'v(integer)' enables or disables various kinds of verbose output on stderr, given by binary codes such as show_choices;
- 'm' (integer)' causes every mth solution to be output (the default is m0, which merely counts them);
- 's (integer)' causes the algorithm to randomize the initial list of items (thus providing some variety, although the solutions are by no means uniformly random);
- 'd(integer)' sets *delta*, which causes periodic state reports on *stderr* after the algorithm has performed approximately *delta* mems since the previous report (default 10000000000);
- 'c (positive integer)' limits the levels on which choices are shown during verbose tracing;
- 'C' positive integer' limits the levels on which choices are shown in the periodic state reports;
- '1 (nonnegative integer)' gives a *lower* limit, relative to the maximum level so far achieved, to the levels on which choices are shown during verbose tracing;
- 't(positive integer)' causes the program to stop after this many solutions have been found;
- 'T(integer)' sets timeout (which causes abrupt termination if mems > timeout at the beginning of a level);
- '\$\(\frac{1}{2}\) filename \(\frac{1}{2}\)' to output a "shape file" that encodes the search tree.

```
#define show_basics 1
                             /* vbose code for basic stats; this is the default */

6 data structures ssxcco §6

6. Data structures. Sparse-set data structures were introduced by Preston Briggs and Linda Torczon [ACM Letters on Programming Languages and Systems **2** (1993), 59–69], who realized that exercise 2.12 in Aho, Hopcroft, and Ullman's classic text The Design and Analysis of Computer Algorithms (Addison-Wesley, 1974) was much more than just a slick trick to avoid initializing an array. (Indeed, TAOCP exercise 2.2.6–24 calls it the "sparse array trick.")

The basic idea is amazingly simple, when specialized to the situations that we need to deal with: We can represent a subset S of the universe $U = \{x_0, x_1, \ldots, x_{n-1}\}$ by maintaining two n-element arrays p and q, each of which is a permutation of $\{0, 1, \ldots, n-1\}$, together with an integer s in the range $0 \le s \le n$. In fact, p is the *inverse* of q; and s is the number of elements of S. The current value of the set S is then simply $\{x_{p_0}, \ldots, x_{p_{s-1}}\}$. (Notice that every s-element subset can be represented in s!(n-s)! ways.)

It's easy to test if $x_k \in S$, because that's true if and only if $q_k < s$. It's easy to insert a new element x_k into S: Swap indices so that $p_s = k$, $q_k = s$, then increase s by 1. It's easy to delete an element x_k that belongs to S: Decrease s by 1, then swap indices so that $p_s = k$ and $q_k = s$. And so on.

Briggs and Torczon were interested in applications where s begins at zero and tends to remain small. In such cases, p and q need not be permutations: The values of p_s , p_{s+1} , ..., p_{n-1} can be garbage, and the values of q_k need be defined only when $x_k \in S$. (Such situations correspond to the treatment by Aho, Hopcroft, and Ullman, who started with an array full of garbage and used a sparse-set structure to remember the set of nongarbage cells.) Our applications are different: Each set begins equal to its intended universe, and gradually shrinks. In such cases, we might as well maintain inverse permutations. The basic operations go faster when we know in advance that we aren't inserting an element that's already present (nor deleting an element that isn't).

Many variations are possible. For example, p could be a permutation of $\{x_0, x_1, \ldots, x_{n-1}\}$ instead of a permutation of $\{0, 1, \ldots, n-1\}$. The arrays that play the role of q in the following routines don't have indices that are consecutive; they live inside of other structures.

7. This program has an array called *item*, with one entry for each item. The value of item[k] is an index x into a much larger array called set. The set of all options that involve the kth item appears in that array beginning at set[x]; and it continues for s consecutive entries, where s = size(x) is an abbreviation for set[x-1]. If item[k] = x, we maintain the relation pos(x) = k, where pos(x) is an abbreviation for set[x-2]. Thus item plays the role of array p, in a sparse-set data structure for the set of all currently active items; and pos plays the role of q.

Suppose the kth item x currently appears in s options. Those options are indices into nd, which is an array of "nodes." Each node has three fields: itm, loc, and clr. If $x \le q < x + s$, let y = set[q]. This is essentially a pointer to a node, and we have nd[y].itm = x, nd[y].loc = q. In other words, the sequential list of s elements that begins at x = item[k] in the set array is the sparse-set representation of the currently active options that contain the kth item. The clr field nd[y].clr contains x's color for this option. The itm and clr fields remain constant, once we've initialized everything, but the loc fields will change.

The given options are stored sequentially in the nd array, with one node per item, separated by "spacer" nodes. If y is the spacer node following an option with t items, we have nd[y].itm = -t. If y is the spacer node preceding an option with t items, we have nd[y].loc = t.

This probably sounds confusing, until you can see some code. Meanwhile, let's take note of the invariant relations that hold whenever k, q, x, and y have appropriate values:

```
pos(item[k]) = k; nd[set[q]].loc = q; item[pos(x)] = x; set[nd[y].loc] = y.
```

(These are the analogs of the invariant relations p[q[k]] = q[p[k]] = k in the simple sparse-set scheme that we started with.)

The set array contains also the item names.

We count one mem for a simultaneous access to the itm and loc fields of a node. Each node actually has a "spare" fourth field, spr, inserted solely to enforce alignment to 16-byte boundaries. (Some modification of this program might perhaps have a use for spr?)

```
#define size(x) set[(x)-1]
                                   /* number of active options of the kth item, x */
#define pos(x) set[(x)-2]
                                  /* where that item is found in the item array */
#define lname(x) set[(x) - 4]
                                     /* the first four bytes of x's name */
#define rname(x) set[(x) - 3]
                                      /* the last four bytes of x's name */
\langle \text{ Type definitions } 7 \rangle \equiv
  typedef struct node_struct {
                 /* the item x corresponding to this node */
                 /* where this node resides in x's active set */
    int loc;
    int clr;
                 /* color associated with item x in this option, if any */
                 /* a spare field inserted only to maintain 16-byte alignment */
    int spr;
  } node;
See also section 9.
```

This code is used in section 2.

8 DATA STRUCTURES SSXCC0 §8

```
8. \langle \text{Global variables } 3 \rangle + \equiv
  node nd[max\_nodes];
                          /* the master list of nodes */
  int last_node;
                   /* the first node in nd that's not yet used */
  int item[max\_cols];
                       /* the master list of items */
  int second = max\_cols;
                             /* boundary between primary and secondary items */
  int last_itm;
                   /* items seen so far during input, plus 1 */
                                        /* the sets of active options for active items */
  int set[max\_nodes + 4 * max\_cols];
                     /* number of elements used in item */
  int itemlength;
                    /* number of elements used in set */
  int setlength;
                 /* current number of active items */
  int active;
  int oactive;
                  /* value of active before swapping out current-choice items */
  int baditem;
                   /* an item with no options, plus 1 */
                   /* setting of second just after initial input */
  int osecond;
```

9. We're going to store string data (an item's name) in the midst of the integer array set. So we've got to do some type coercion using low-level C-ness.

```
\langle \text{Type definitions } 7 \rangle + \equiv
  typedef struct {
     int l, r;
  } twoints;
  typedef union {
     unsigned char str[8];
                                   /* eight one-byte characters */
     twoints lr;
                      /* two four-byte integers */
  } stringbuf;
  stringbuf namebuf;
10. \langle \text{Subroutines } 10 \rangle \equiv
  void print_item_name(int k, FILE *stream)
     namebuf.lr.l = lname(k), namebuf.lr.r = rname(k);
     fprintf(stream, " \sqcup "O".8s", namebuf.str);
See also sections 11, 12, 13, 32, 38, 39, and 40.
This code is used in section 2.
```

§11 SSXCC0 DATA STRUCTURES 9

11. An option is identified not by name but by the names of the items it contains. Here is a routine that prints an option, given a pointer to any of its nodes. It also prints the position of the option in its item list.

```
\langle Subroutines 10\rangle + \equiv
  void print_option(int p, FILE *stream)
     register int k, q, x;
     x = nd[p].itm;
     if (p \ge last\_node \lor x \le 0) {
       fprintf(stderr, "Illegal_option_"O"d!\n", p);
       return;
     for (q = p; ; )  {
       print\_item\_name(x, stream);
       if (nd[q].clr) fprintf (stream, ":"O"c", nd[q].clr);
       q++;
       x = nd[q].itm;
       if (x < 0) q += x, x = nd[q].itm;
       if (q \equiv p) break;
     k = nd[q].loc;
    fprintf(stream, " ("O" d of "O" d) n", k - x + 1, size(x));
  void prow(\mathbf{int} \ p)
    print\_option(p, stderr);
     When I'm debugging, I might want to look at one of the current item lists.
\langle \text{Subroutines } 10 \rangle + \equiv
  void print_itm(\mathbf{int} \ c)
  {
     register int p;
    if (c < 4 \lor c \ge setlength \lor pos(c) < 0 \lor pos(c) \ge itemlength \lor item[pos(c)] \ne c) {
       fprintf(stderr, "Illegal_item_i"O"d!\n", c);
       return;
     fprintf(stderr, "Item");
     print\_item\_name(c, stderr);
     if (c < second) fprintf(stderr, "u("O"d_uof_u"O"d), length_u"O"d: \n", <math>pos(c) + 1, active, size(c));
     else if (pos(c) \ge active)
       fprintf(stderr, " (secondary "O"d, purified), length "O"d: n", pos(c) + 1, size(c));
     else fprintf(stderr, "u(secondaryu"O"d), ulengthu"O"d: \n", pos(c) + 1, size(c));
     for (p = c; p < c + size(c); p \leftrightarrow) prow(set[p]);
```

10 DATA STRUCTURES SSXCC0 §13

13. Speaking of debugging, here's a routine to check if redundant parts of our data structure have gone awry.

```
\#define sanity\_checking 0
                                   /* set this to 1 if you suspect a bug */
\langle \text{Subroutines } 10 \rangle + \equiv
  void sanity(void)
     register int k, x, i, l, r, q, qq;
     for (k = 0; k < itemlength; k++) {
       x = item[k];
       if (pos(x) \neq k) {
         fprintf(stderr, "Bad_{\square}pos_{\square}field_{\square}of_{\square}item");
         print\_item\_name(x, stderr);
         fprintf(stderr, " \cup ("O"d, "O"d)! \setminus n", k, x);
       }
    for (i = 0; i < last\_node; i++) {
       l = nd[i].itm, r = nd[i].loc;
       if (l \le 0) {
         if (nd[i+r+1].itm \neq -r) fprintf(stderr, "Bad_uspacer_uin_unodes_u"O"d,u"O"d!\n",i,i+r+1);
          qq = 0;
       } else {

       \langle \text{ Expand } set \text{ 20} \rangle;
      \langle \text{Adjust } nd \ 21 \rangle;
This code is used in section 2.
```

This code is used in section 16.

We temporarily use pos to recognize duplicate items in an option. \langle Create a node for the item named in buf[p] 17 $\rangle \equiv$ for $(k = (last_itm - 1) \ll 2; k; k = 4)$ { if $(o, lname(k) \neq namebuf.lr.l)$ continue; if $(rname(k) \equiv namebuf.lr.r)$ break; if $(\neg k)$ $panic("Unknown_{\bot}item_{\bot}name");$ if (o, pos(k) > i) $panic("Duplicate_item_name_in_this_option");$ $last_node ++;$ if $(last_node \equiv max_nodes)$ $panic("Too_{\square}many_{\square}nodes");$ /* how many previous options have used this item? */ o, t = size(k); $o, nd[last_node].itm = k \gg 2, nd[last_node].loc = t;$ if $((k \gg 2) < second)$ pp = 1; $o, size(k) = t + 1, pos(k) = last_node;$ This code is used in section 16. 18. $\langle \text{Remove } last_node \text{ from its item list } 18 \rangle \equiv$ $o, k = nd[last_node].itm \ll 2;$ oo, size(k) ---, pos(k) = i - 1;This code is used in section 16. **19.** $\langle \text{ Initialize } item \ 19 \rangle \equiv$ $active = itemlength = last_itm - 1;$ for (k = 0, j = 4; k < itemlength; k++) oo, $item[k] = j, j += 4 + size((k+1) \ll 2);$ setlength = i - 4;**if** $(second \equiv max_cols)$ osecond = active, second = j;else osecond = second - 1; This code is used in section 16. **20.** Going from high to low, we now move the item names and sizes to their final positions (leaving room for the pointers into nb). $\langle \text{ Expand } set \text{ 20} \rangle \equiv$ **for** (; k; k--) { o, j = item[k-1];**if** $(k \equiv second)$ second = j; /* second is now an index into set */ $oo, size(j) = size(k \ll 2);$ **if** $(size(j) \equiv 0 \land k \leq osecond)$ baditem = k; o, pos(j) = k - 1; $oo, rname(j) = rname(k \ll 2), lname(j) = lname(k \ll 2);$ This code is used in section 16. **21.** $\langle \text{Adjust } nd \text{ 21} \rangle \equiv$ for $(k = 1; k < last_node; k++)$ { if (o, nd[k].itm < 0) continue; /* skip over a spacer */ o, j = item[nd[k].itm - 1];i = j + nd[k].loc; /* no mem charged because we just read nd[k].itm */ o, nd[k].itm = j, nd[k].loc = i;o, set[i] = k;

This code is used in section 2.

14

```
22. ⟨Report an uncoverable item 22⟩ ≡
{
    if (vbose & show_choices) {
        fprintf(stderr, "Item");
        print_item_name(item[baditem - 1], stderr);
        fprintf(stderr, "_has_no_options!\n");
    }
}
```

23. The "number of entries" includes spacers (because DLX2 includes spacers in its reports). If you want to know the sum of the option lengths, just subtract the number of options.

```
\langle \text{Report the successful completion of the input phase 23} \rangle \equiv fprintf(stderr, "("O"lld_options,_\"O"d+"O"d_items,_\"O"d_lentries_\successfully_\read)\n", options, osecond, itemlength - osecond, last_node);
This code is used in section 2.
```

24. The item lengths after input are shown (on request). But there's little use trying to show them after the process is done, since they are restored somewhat blindly. (Failures of the linked-list implementation in DLX2 could sometimes be detected by showing the final lengths; but that reasoning no longer applies.)

25. \langle Randomize the item list $25 \rangle \equiv$ for (k = active; k > 1;) { $mems += 4, j = gb_unif_rand(k);$ k--; oo, oo, t = item[j], item[j] = item[k], item[k] = t; oo, pos(t) = k, pos(item[j]) = j;}

This code is used in section 2.

 $\S26$ SSXCC0 The dancing 15

26. The dancing. Our strategy for generating all exact covers will be to repeatedly choose an item that appears to be hardest to cover, namely an item whose set is currently smallest, among all items that still need to be covered. And we explore all possibilities via depth-first search.

The neat part of this algorithm is the way the sets are maintained. Depth-first search means last-in-firstout maintenance of data structures; and the sparse-set representations make it particularly easy to undo what we've done at deeper levels.

The basic operation is "covering an item." That means removing it from the set of items needing to be covered, and "hiding" its options: removing them from the sets of the other items they contain.

```
\langle Solve the problem _{26}\rangle \equiv
     level = 0;
  forward: nodes ++;
     if (vbose & show_profile) profile[level]++;
     if (sanity_checking) sanity();
     \langle Do special things if enough mems have accumulated 28\rangle;
     \langle \text{Set } best\_itm \text{ to the best item for branching } 34 \rangle;
     if (t \equiv max\_nodes) \( \text{Visit a solution and goto } backup \( \frac{35}{2} \);
     \langle \text{Swap } best\_itm \text{ out of the active list } 29 \rangle;
     oactive = active, hide(best\_itm, 0, 0);
                                                     /* hide its options */
     cur\_choice = best\_itm;
     (Save the currently active sizes 36);
  advance: oo, cur\_node = choice[level] = set[cur\_choice];
  tryit: if ((vbose \& show\_choices) \land level < show\_choices\_max)  {
       fprintf(stderr, "L"O"d:", level);
        print_option(cur_node, stderr);
     \langle Swap out all other items of cur_node 30\rangle:
     \langle Hide the other options of those items, or goto abort 31\rangle;
     if (++level > maxl) {
       if (level \geq max\_level) {
          fprintf(stderr, "Too many levels! \n");
          exit(-4);
        maxl = level;
     goto forward;
  backup: if (level \equiv 0) goto done;
     level ---;
     oo, cur\_node = choice[level], best\_itm = nd[cur\_node].itm, cur\_choice = nd[cur\_node].loc;
  abort: if (o, cur\_choice + 1 \ge best\_itm + size(best\_itm)) goto backup;
     \langle Restore the currently active sizes 37 \rangle;
     cur_choice ++; goto advance;
This code is used in section 2.
```

16 THE DANCING SSXCC0 §27

27. We save the sizes of active items on savestack, whose entries have two fields l and r, for an item and its size. This stack makes it easy to undo all deletions, by simply restoring the former sizes.

```
\langle \text{Global variables } 3 \rangle + \equiv
  int level;
                  /* number of choices in current partial solution */
  int choice[max_level];
                               /* the node chosen on each level */
                                  /* size of savestack on each level */
  int saved[max\_level + 1];
  ullng profile[max_level];
                                  /* number of search tree nodes on each level */
  twoints savestack[savesize];
                    /* current size of savestack */
  int saveptr;
28. (Do special things if enough mems have accumulated 28) \equiv
  if (delta \land (mems \ge thresh)) {
     thresh += delta;
     if (vbose & show_full_state) print_state();
     else print_progress();
  if (mems \ge timeout) {
     fprintf(stderr, "TIMEOUT! \n"); goto done;
This code is used in section 26.
29. \langle \text{Swap } best\_itm \text{ out of the active list } 29 \rangle \equiv
  p = active - 1, active = p;
  o, pp = pos(best\_itm);
  o, cc = item[p];
  oo, item[p] = best\_itm, item[pp] = cc;
  oo, pos(cc) = pp, pos(best\_itm) = p;
  updates ++;
This code is used in section 26.
```

30. Note that a colored secondary item might have already been purified, in which case it has already been swapped out. We don't want to tamper with any of the inactive items.

```
 \langle \text{Swap out all other items of } cur\_node \ 30 \rangle \equiv \\ p = oactive = active; \\ \textbf{for } (q = cur\_node + 1; \ q \neq cur\_node; \ ) \ \{ \\ o, c = nd[q].itm; \\ \textbf{if } (c < 0) \ q += c; \\ \textbf{else } \{ \\ o, pp = pos(c); \\ \textbf{if } (pp < p) \ \{ \\ o, cc = item[--p]; \\ oo, item[p] = c, item[pp] = cc; \\ oo, pos(cc) = pp, pos(c) = p; \\ updates ++; \\ \} \\ q++; \\ \} \\ active = p; \\ \text{This code is used in section 26}.
```

§31 SSXCC0 THE DANCING 17

31. A secondary item was purified at lower levels if and only if its position is \geq oactive.

```
 \begin{tabular}{ll} $\langle$ \mbox{ Hide the other options of those items, or $\it{goto}$ $\it{abort}$ $\it{31}$ $\rangle$ $\equiv $\it{for}$ $(q=cur\_node+1; $q\neq cur\_node; $)$ $\{$ $\it{o,cc}=nd[q].itm;$ $\it{if}$ $(cc<0)$ $q+=cc;$ $\it{else}$ $\{$ $\it{if}$ $(cc<second)$ $\{$ $\it{if}$ $(hide(cc,0,1)\equiv 0)$ $\it{goto}$ $\it{abort};$ $\}$ $\it{else}$ $\{$ $\it{/*}$ $\it{do}$ nothing if $\it{cc}$ already purified */$ $\it{o,pp}=pos(cc);$ $\it{if}$ $(\it{pp}<\it{oactive}\land(o,hide(cc,nd[q].clr,1)\equiv 0))$ $\it{goto}$ $\it{abort};$ $\}$ $\it{q}++;$ $\}$ $\}$ }
```

This code is used in section 26.

32. The *hide* routine hides all of the incompatible options remaining in the set of a given item. If *check* is nonzero, it returns zero if that would cause a primary item to be uncoverable.

If the *color* parameter is zero, all options are incompatible. Otherwise, however, the given item is secondary, and we retain options for which that item has a *color* match.

When an option is hidden, it leaves all sets except the set of that given item. And the given item is inactive. Thus a node is never removed from a set twice.

```
 \langle \text{Subroutines 10} \rangle +\equiv \\ & \textbf{int } hide(\textbf{int } c, \textbf{int } color, \textbf{int } check) \\ \{ & \textbf{register int } cc, s, rr, ss, nn, tt, uu, vv, nnp; \\ & \textbf{for } (o, rr = c, s = c + size(c); \ rr < s; \ rr ++) \ \{ \\ & o, tt = set[rr]; \\ & \textbf{if } (\neg color \lor (o, nd[tt].clr \neq color)) \ \langle \text{Remove option } tt \text{ from the other sets it's in } 33 \rangle; \\ & \text{return 1}; \\ \}
```

18 THE DANCING SSXCC0 $\S 33$

```
\langle Remove option tt from the other sets it's in 33\rangle \equiv
33.
  {
     for (nn = tt + 1; nn \neq tt;)
       o, uu = nd [nn].itm, vv = nd [nn].loc;

              fprintf(stderr, "\_can't\_cover");
              print\_item\_name(uu, stderr);
              fprintf(stderr, "\n");
            return 0;
         o, nnp = set[uu + ss];
         o, size(uu) = ss;
         oo, set[uu + ss] = nn, set[vv] = nnp;
         oo, nd[nn].loc = uu + ss, nd[nnp].loc = vv;
         updates ++;
       }
       nn ++;
```

This code is used in section 32.

ξ34 SSXCC0 19 THE DANCING

The "best item" is considered to be an item that minimizes the number of remaining choices. If there are several candidates, we choose the leftmost.

Notice that a secondary item is active if and only if it has not been purified (that is, if and only if it hasn't yet appeared in a chosen option).

(This program explores the search space in a slightly different order from DLX2, because the ordering of items in the active list is no longer fixed. Thus ties are broken in a different way when s=1.)

```
\langle \text{Set } best\_itm \text{ to the best item for branching } 34 \rangle \equiv
  t = max\_nodes, tmems = mems;
  if ((vbose \& show\_details) \land level < show\_choices\_max \land level \ge maxl - show\_choices\_qap)
     fprintf(stderr, "Level_{\sqcup}"O"d:", level);
  for (k = 0; t > 1 \land k < active; k++)
     if (o, item[k] < second) {
```

```
o, s = size(item[k]);
     if ((vbose \& show\_details) \land level < show\_choices\_max \land level \ge maxl - show\_choices\_qap) {
       print\_item\_name(item[k], stderr);
       fprintf(stderr, "("O"d)", s);
    if (s \le t) {
       if (s < t) {
         if (s \equiv 0) fprintf (stderr, "I'm_{\sqcup}confused.\n");
                                                                  /* hide missed this */
          best\_itm = item[k], t = s;
       else if (item[k] < best\_itm) best\_itm = item[k];
                                                                /* suggested by P. Weigel */
     }
if ((vbose \& show\_details) \land level < show\_choices\_max \land level \ge maxl - show\_choices\_qap) {
  if (t \equiv max\_nodes) fprintf(stderr, "\u00cdsolution\n");
  else {
    fprintf(stderr, "\_branching\_on");
    print_item_name(best_itm, stderr);
    fprintf(stderr, "("O"d)\n", t);
  }
if (t > maxdeg \land t < max\_nodes) maxdeg = t;
if (shape_file) {
  if (t \equiv max\_nodes) fprintf(shape\_file, "sol\n");

     }
  }
```

 $\S39$ SSXCC0 The dancing 21

```
void print_state(void)
{
    register int l;
    fprintf(stderr, "Current_state_l(level_l"O"d):\n", level);
    for (l = 0; l < level; l++) {
        print_option(choice[l], stderr);
        if (l ≥ show_levels_max) {
            fprintf(stderr, "_l...\n");
            break;
        }
     }
     fprintf(stderr, "_l"O"lld_solutions, "O"lld_mems, "and "max_level" O"d_so_lfar.\n", count,
            mems, maxl);
}</pre>
```

40. During a long run, it's helpful to have some way to measure progress. The following routine prints a string that indicates roughly where we are in the search tree. The string consists of character pairs, separated by blanks, where each character pair represents a branch of the search tree. When a node has d descendants and we are working on the kth, the two characters respectively represent k and d in a simple code; namely, the values $0, 1, \ldots, 61$ are denoted by

```
0, 1, \ldots, 9, a, b, \ldots, z, A, B, \ldots, Z.
```

All values greater than 61 are shown as '*'. Notice that as computation proceeds, this string will increase lexicographically.

Following that string, a fractional estimate of total progress is computed, based on the naïve assumption that the search tree has a uniform branching structure. If the tree consists of a single node, this estimate is .5; otherwise, if the first choice is 'k of d', the estimate is (k-1)/d plus 1/d times the recursively evaluated estimate for the kth subtree. (This estimate might obviously be very misleading, in some cases, but at least it tends to grow monotonically.)

```
\langle \text{Subroutines } 10 \rangle + \equiv
  void print_progress(void)
     register int l, k, d, c, p, ds = 0:
     register double f, fd;
     fprintf(stderr, "\_after\_"O"lld\_mems:\_"O"lld\_sols, ", mems, count);
     for (f = 0.0, fd = 1.0, l = 0; l < level; l \leftrightarrow) {
        c = nd[choice[l]].itm, d = size(c), k = nd[choice[l]].loc - c + 1;
                                            /* choice l is k of d */
        fd *= d, f += (k-1)/fd;
        if (l < show\_levels\_max)
          fprintf(stderr, "_{\sqcup}"O"c"O"c", k < 10? '0' + k : k < 36? 'a' + k - 10 : k < 62? 'A' + k - 36 : '*',
                d < 10? '0' + d : d < 36? 'a' + d - 10 : d < 62? 'A' + d - 36 : '*');
        else if (\neg ds) ds = 1, fprintf(stderr, "...");
     \textit{fprintf} \left( \textit{stderr}, \texttt{"} \_ \texttt{"} O \texttt{".5f} \verb"", f + 0.5 / \textit{fd} \right);
      \langle \text{ Print the profile 41} \rangle \equiv
     fprintf(stderr, "Profile:\n");
     for (level = 0; level \le maxl; level ++) fprintf(stderr, ""O"3d: "O"11d\n", level, profile[level]);
This code is used in section 2.
```
