§1 RANDOM-DFS-A INTRO 1

**1.** Intro. Given m and n, this program does a depth-first search on the random digraph with vertices  $\{1, \ldots, n\}$  that has m arcs, where each arc  $u \longrightarrow v$  goes from a uniformly random vertex u to a uniformly random vertex v.

By depth-first search I mean Algorithm 7.4.1.1D. That algorithm converts a given digraph into what Tarjan called a "jungle," consisting of an oriented forest plus nontree arcs called back arcs, forward arcs, and cross arcs. My goal is to understand the distribution of those different flavors of arcs.

Actually two other parameters are given on the command line: The number of repetitions, reps, and the random seed, seed.

```
#define maxm = 100000000
#include <stdio.h>
#include <stdlib.h>
#include <math.h>
#include "gb_flip.h"
        int m, n, reps, seed;
                                                                                                      /* command-line parameters */
         \langle \text{Type definitions } 8 \rangle;
         \langle \text{Global variables 4} \rangle;
         \langle \text{Subroutines 9} \rangle;
         main(\mathbf{int} \ argc, \mathbf{char} * argv[])
                 register int i, j, k, r;
                 ⟨Local variables for depth-first search 6⟩;
                 \langle \text{Process the command line } 2 \rangle;
                 for (r = 0; r < reps; r++) {
                           \langle Generate the random arcs 3\rangle;
                           \langle \text{ Do a depth-first search 5} \rangle;
                           \langle \text{Update the statistics } 12 \rangle;
                   \langle \text{ Print the statistics } 13 \rangle;
2. \langle \text{Process the command line } 2 \rangle \equiv
        if (argc \neq 5 \lor sscanf(argv[1], "%d", \&m) \neq 1 \lor sscanf(argv[2], "%d", \&n) \neq 1 \lor sscanf(argv[3], "%d", \&n) \Rightarrow 1 \lor sscanf(argv[3
                                   \&reps) \neq 1 \lor sscanf(argv[4], "%d", \&seed) \neq 1) {
                 fprintf(stderr, "Usage: \_\%s \_m \_n \_reps \_seed \n", argv[0]);
                 exit(-1);
         if (m > maxm \lor n > maxm) {
                 fprintf(stderr, "Recompile\_me: \_I\_can\_only\_handle\_m, n <= %d! \n", maxm);
                 exit(-2);
         gb\_init\_rand(seed);
         printf("Depth-first\_search\_model\_A,\_seed\_%d.\n", seed);
This code is used in section 1.
```

2 INTRO RANDOM-DFS-A §3

The arcs from vertex v are tip[k] for  $arcs[v] \le k < arcs[v+1]$ . Uniform random numbers allow us some flexibility to mix and match. First I figure out how many arcs have a given source u, then I generate the targets.  $\langle$  Generate the random arcs  $3\rangle \equiv$ for (k = 0; k < m; k++) arcs[k] = 0;for (k = 0; k < m; k++)  $arcs[qb\_unif\_rand(n)]++;$ for (j = k = 0; k < n; j += i, k++) i = arcs[k], arcs[k] = j;if  $(j \neq m)$  printf("I'm\_confused!\n"); arcs[n] = j;for  $(k = 0; k < m; k++) tip[k] = gb\_unif\_rand(n);$ This code is used in section 1. **4.**  $\langle$  Global variables  $4 \rangle \equiv$ int arcs[maxm + 1];/\* where arcs begin in the tip table \*/ int tip[maxm]; /\* tips of the arcs \*/ See also sections 7 and 11. This code is used in section 1. 5.  $\langle \text{ Do a depth-first search 5} \rangle \equiv$ d1: roots = backs = forwards = loops = crosses = maxlev = 0;for (w = 0; w < n; w++) par[w] = post[w] = 0;p = q = 0;d2: while (w) { v = w = w - 1;if (par[v]) continue; d3: par[v] = n + 1, level[v] = 0, arc[v] = arcs[v], pre[v] = ++p, roots ++;d4: if  $(arc[v] \equiv arcs[v+1])$  { post[v] = ++q, v = par[v] - 1;goto d8; d5: u = tip[arc[v]++];  $d\theta$ : if (par[u]) { /\* nontree arc \*/ **if** (pre[u] > pre[v]) forwards ++; else if  $(pre[u] \equiv pre[v])$  loops ++;else if  $(\neg post[u])$  backs ++; else crosses ++;goto d4; d7: par[u] = v + 1, level[u] = level[v] + 1, v = u, arc[v] = arcs[v], pre[v] = ++p;**if** (level[u] > maxlev) maxlev = level[u];goto d4; d8: if  $(v \neq n)$  goto d4; This code is used in section 1.

**6.**  $\langle$  Local variables for depth-first search  $6 \rangle \equiv$  **register int** a, u, v, w, p, q, roots, backs, forwards, loops, crosses, maxlev; This code is used in section 1.

 $\S 7$  Random-dfs-a intro 3

```
7. \( \) Global variables 4 \( \) +\( \) +\( \) int \( par[maxm]; \) /* \( parent \) pointers \( plus 1, \) or 0 */
int \( pre[maxm]; \) /* \( preorder \) index, \( or 0 */ \) int \( arc[maxm]; \) /* \( the \) current \( next \) arc \( to \) examine */
int \( level[maxm]; \) /* \( tree \) distance \( from \) the \( root */ \)
```

4 STATISTICS RANDOM-DFS-A §8

8. Statistics. I'm keeping the usual sample mean and sample variance, using the general purpose routines that I've had on hand for more than 20 years.

```
\langle Type definitions _{8}\rangle \equiv
   typedef struct {
      double mean, var;
      int n;
   } stat;
This code is used in section 1.
    \langle \text{Subroutines } 9 \rangle \equiv
   void record\_stat(q, x)
         \mathbf{stat} *q;
         int x;
      register double xx = (double) x;
      if (q→n++) {
         double tmp = xx - q \rightarrow mean;
         q \rightarrow mean += tmp/q \rightarrow n;
         q \rightarrow var += tmp * (xx - q \rightarrow mean);
      else {
         q \rightarrow mean = xx;
         q \rightarrow var = 0.0;
   }
See also section 10.
This code is used in section 1.
10. \langle \text{Subroutines } 9 \rangle + \equiv
   void print_{-}stat(q)
        \mathbf{stat} *q;
      printf("\%g_{\sqcup}+-_{\sqcup}\%g", q\rightarrow mean, q\rightarrow n > 1 ? sqrt(q\rightarrow var/(q\rightarrow n-1)) : 0.0); /* standard deviation */
11. \langle \text{Global variables 4} \rangle + \equiv
   stat rootstat, backstat, forwardstat, loopstat, crossstat, maxlevstat;
12.
      \langle \text{Update the statistics } 12 \rangle \equiv
   record_stat(&rootstat, roots);
   record_stat(&backstat, backs);
   record_stat(&forwardstat, forwards);
   record\_stat(\&loopstat, loops);
   record\_stat(\&crossstat, crosses);
   record\_stat(\& maxlevstat, maxlev);
This code is used in section 1.
```

§13 RANDOM-DFS-A STATISTICS 5

```
13. \langle Print \text{ the statistics } 13 \rangle \equiv printf("During_\%d_\repetitions_\with_\%d_\repetitions_\with_\%d_\repetitions_\lambda in, reps, n, m); print_stat(&rootstat); printf("\reptitions\tangle \text{n"}); print_stat(&backstat); printf("\reptitions\tangle \text{n"}); print_stat(&forwardstat); printf("\reptitionnoloop\reptitions\tangle \text{n"}); printf("\reptitionnoloop\text{noops}\text{n"}); printf("\reptitionops\text{n"}); printf("\reptitionops\text{n"}); printf("\reptitionops\text{n}"); print_stat(&crossstat); printf("\reptitionops\text{naslevstat}); printf("\reptitionops\text{naslevstat}); printf("\reptitionops\text{naslevstat}); printf("\reptitionops\text{naslevstat}); printf("\reptitionops\text{naslevstat}); printf("\reptitions\text{naslevstat}); printf("\reptions\text{naslevstat}); printf("\reptitions\text{naslevstat}); printf("\reptitions\text{naslevstat}
```
